

The design goals of this historical and prominent site are to represent and cherish the history of the Northern Avenue Bridge through fragmenting and recreating the primary structural truss system. A central truss system forms the bridge's core and glass cube enclosures provide main circulation moments along the bridge's pedestrian, bike, landscape, and sea experience. Vessels pass through the glass cube by a vertical lift bridge system. The bike lane and the pedestrian path intersect the glass cube. Additional dock space with an open-air exhibition space is situated below the bridge.
